Noritake itron

Specification: **GU128X64D-K612A8**
V F D M o d u l e

Features: **128x64 High Brightness Dot Graphic Display**
Single 5V DC Supply
4 ASCII Fonts (5x5, 5x7, 10x14, 7x15)
Asynchronous & Parallel interfaces
8 User I/O Pins with Key Scanning Capability

Reference: 10809
Issue Date: 7th February 2008
Revision: F1

GU128x64D-K612A8

1.0 General Description

1.1 Scope

This specification covers the operating requirements of the vacuum fluorescent graphic display module GU128x64D-K612A8.

1.2 Construction

The module consists of a 128 x 64 dot graphic CIG-VFD, refresh RAM, character generator, DC/DC converter, display controller, and all necessary control logic. The interface type can be selected by a push button on the back of the module. The module can simultaneously display graphic patterns and / or characters on the screen.

1.3 Outline

Power supply: + 5 V_{DC} only
Interface: Parallel interface (CMOS)
                 RS232 Asynchronous Serial Interface
Function: Character / Graphic display
                 Control commands
                 Character and Graphic Image Download
                 Auto key scanning
                 8 User I/O Pins

Applied reliability spec: TT-99-3102

1.4 Block Diagram
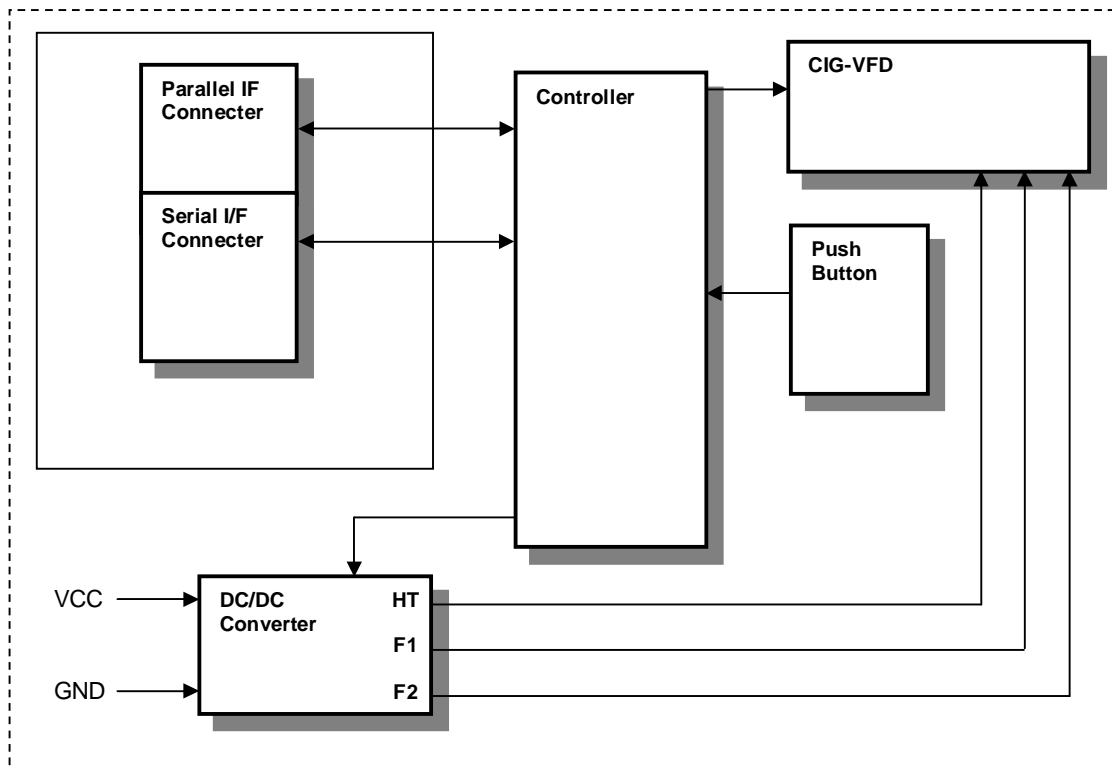

2.0   Electrical Specification

2.1   Absolute Maximum Ratings

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition	Note
Power Supply Voltage	VCC	-0.3	-	5.5	VDC	GND=0V	5V, 0V
Logic Input Voltage	VIN	-0.3	-	Vcc + 0.3	VDC	GND=0V	/RES, ENABLE, PA0-PA7
RS232 Input Voltage	VIN	-30	-	+30	VDC	GND=0V	RXD, HB

2.2   Electrical Ratings

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition	Note
Power Supply Voltage	VCC	4.5	5.0	5.25	VDC	GND=0V	-

All driving voltages for the VFD are supplied by the DC/DC converter on board.

2.3   Electrical Characteristics

Measuring Conditions: Ambient temperature = 25º C

Parameter		Symbol	Min	Typ	Max	Unit	Condition	Note
"H" Level Logic Input Current		IIH	-	-	1.0	uADC	VCC = 5.5V, Pin High (Absolute value)	/RES, ENABLE, PA0-PA7, RXD, MB1
"L" Level Logic Input Current		IIL	-	-	1.0	uADC	VCC = 5.5V, Pin Low (Absolute value)	
Logic Input Voltage	"H"	VIH	-0.5	-	0.2 VCC	VDC	VCC = 5V	/RES, ENABLE, PA0-PA7
	"L"	VIL	0.6 VCC	-	VCC + 0.5	VDC	VCC = 5V	
Logic Output Voltage	"H"	VOH	4.0	-	-	VDC	IOH = 20mA VCC = 5V	PA0-PA7, MB1
	"L"	VOL	0	-	0.7	VDC	IOL = -20mA VCC = 5V	
RS232 Input Voltage	"H"	VIH	-	1.7	2.4	VDC	VCC = 5V	RXD, HB
	"L"	VIL	0.8	1.2	-	VDC	VCC = 5V	
RS232 Output Voltage	"H"	VOH	5	7	-	VDC	3kΩ to GND VCC = 5V	TXD, MB2
	"L"	VOL	-	-7	-5	VDC	3kΩ to GND VCC = 5V	
Power Supply Current 1		ICC1	370	412	453	mADC	VCC = 5V	All dots on
Power Supply Current 2		ICC2	316	352	387	mADC	VCC = 5V	All dots off
Power Supply Current 3		ICC3	44	49	54	mADC	VCC = 5V	Power off mode

The power supply should be capable of supplying a higher current (x2) at 'power on' for 100ms

3.0   Optical Specifications

Number of dots:	128 x 64(X x Y)
PCB Size:	96.0mm x 46.5mm(X x Y)
Display area:	57.45mm x 28.65mm(X x Y)
Dot size:	0.3mm x 0.3mm(X x Y)
Dot pitch:	0.45mm x 0.45mm(X x Y)
Luminance:	800cd/m^2 Typ
Colour of illumination:	Blue-Green (Filter for colours)

4.0   Environmental Specifications

Operating temperature:	-40 to +85 degrees C
Storage temperature:	-40 to +85 degrees C
Storage humidity:	10 to 90 % @ 25 degrees C
Vibration:	10-55-10Hz, all amplitude 1mm, 30Min., X-Y-Z (Non operating)
Shock:	392m/s^2 (40G) 9mS X-Y-Z, 3times each direction (Non operating)

5.0   Interface

5.1   Type of Interface

The following interfaces are available on this module;
Slow parallel interface (ENABLE, PA0 – PA7, MB1, HB, /RES)
Asynchronous Serial Interface (RXD, TXD, HB, MB2, /RES)

5.2   Parallel Interface

5.2.1 Basic Function

The parallel interface allows for 8 bits to be clocked into the module at a time by placing the 8 data bits on PA0 – PA7 and then clocking them into the module with the Enable line. The module sets the BUSY line upon receipt of data, and clears the line when ready to receive more data. Parallel communications are selected with a push switch at the back of the module.

5.2.2 Parallel Interface Timing

The 8 I/O lines can be configured as a slow parallel interface. Data on PA0-7 is clocked into the module with the Enable line this can be set to either a rising or falling edge trigger by the push switch on the back of the module. The host must keep the data stable for the time period indicated in the timing diagram. The module busy line (MB1) can be used in parallel communication mode.
8-Bit Data/Command Write Timing Diagram.
The busy state can be monitored directly from CON1 pin 9.
The input lines PA0-PA7 are not internally pulled up.
The host system should be configured to ensure the stability of these lines.

5.3 Serial Interface

5.3.1 Basic Function

Asynchronous serial interface is provided at RS232 level. Serial communication is selected with a push switch at the back of the module.

5.3.2 Asynchronous Serial Interface Timing

The asynchronous communication speed and parity can be set with the push switch on the rear of the module, or with the 'SET SERIAL COMMS' command. The default settings are 19200 baud with no parity.

The host busy line (HB) stops the module from sending data to the host. The use of the HB and MB2 lines are optional, and can be connected together if not required.
Host to Module Write
Module to Host Write
5.4   Reset

The module is reset when a low-level signal is applied to the /RES line. This will cause the Module to clear the display, initialise the communication settings and set all power-up defaults. During this initialisation period, the user must delay any transmission to the module. If the user stores macros in EEPROM, the auto check and repair routine may take up to 9ms per stored byte in addition to the standard reset time.
5.5   Serial Buffer

A 256-byte serial receive buffer can be activated through the setup switch on the rear of the module. This buffer can be used with any of the available serial communication modes. The buffer can also be enabled through the 'Set Serial Comms' command (see command table). Once enabled, any I/O data transmitted from the display module due to a read request or automatic I/O read, will be preceded with an identification character. Character 49H ('I') precedes I/O data bytes and 43H ('C') precedes checksum data bytes.

5.6   Packet Mode

The packet mode offers a more secure communication for display writing. The packet mode can be used with any of the available serial communication modes. The packet mode can also be enabled through the 'Set Serial Comms' command (see command table). Up to 32-bytes of data can be sent to the display module, encapsulated with a header (02H) and footer (03H) byte. The length of the packet should follow the header byte. An 8-bit checksum is used to validate the data. This checksum is the sum of the data bytes. The display acknowledges the packet with a 50H ('P') code for successful transfer, or a 45H ('E') for a data error.

HEADER (02H)	DATA LENGTH (1-32)	DATA	DATA	//	DATA	DATA	CHECKSUM	FOOTER (03H)

Example packet transfer

HEADER	LENGTH		DATA		CHECKSUM	FOOTER	ACKNOWLEDGE BYTE SENT FROM DISPLAY
02H	13H	19H 1BH 98H 0BH	10H 00H 0FH	"Packet Write"	79H	03H	50H

RESET | SELECT FONT | SET CURSOR | TEXT
If an error occurs, the display module will discard the data, the host should then re-send the entire packet. If the packet is received correctly, then the data is placed within the 256-byte receive buffer. The receive buffer is enabled automatically when using packet mode.

5.7   EEPROM Protection

The EEPROM contains information such as macro data, asynchronous communication settings and I/O configuration. So it is important to protect this information from stray commands due to communication failures. To protect the EEPROM, the module contains an 'EEPROM Lock' command (1BH + 4CH). Once this command is issued, no further EEPROM updates can be made until it is unlocked (1BH + 55H). This feature is also accessible from the set up menu, using the push button switch on the rear of the module. During reset, EEPROM is automatically checked and repaired. When macros are stored, the module remains busy for 9ms per stored byte.

5.8   Keyboard Control

All 8 I/O lines can be configured to scan a key matrix with up to 16 keys. The 1BH + 4BH command will configure the I/O lines to key scan mode. The I/O port status will indicate the row/column position of the pressed key. The ENABLE line acts as hardware scan enable input, and should be tied to ground.
The following example enables the key-scanning mode and the automatic I/O send when using asynchronous communications.

On each key press, the I/O port status will be sent out of the asynchronous communication port. Eg, pressing key switch 1, the module will send 03H to the host system.

5.9   I/O Control

The module contains simple Input and Output functions for the 8 I/O lines (PA0-PA7).All inputs include an optional pull-up resistor, 30K-120K in value. The outputs can source ~5mA and sink ~30mA.

The following example sets up the I/O lines to control the 2 LED's and provide a pull-up resistor for the switch.

ENABLE I/O MODE	P0/1 = OUT, P7 = IN		SET I/O LINES	ENABLE P7 PULL-UP, TURN ON LED1&2
1BH 44H	**80H**		**1BH 4FH**	**80H**
With asynchronous communications enabled, the status of PA0-PA7 can be transmitted when a change in level is detected on any pin. This automatic response mode can be enabled by using the 'UART SETUP' command. When this mode is enabled, the VFD module can reliably check port changes every 15ms. With auto send disabled (default) a manual read command is required to determine the port status.

READ PORT		SW1 CLOSED	SW1 OPEN
1BH 52H	RESPONSE →	**00H**	**80H**
When I/O control is used, the Enable line can be used as an active low read or write strobe. With the I/O read command, the enable line Will clock before the module reads the I/O port status. With the I/O write command, the enable line will clock after the I/O lines have been set.

I/O Write & Read.
6.0   Software Commands

Busy times are not inclusive of a 100us scan period, this must be taken into consideration. If the cursor is enabled, busy times will increase by a further 50us. All coordinates are absolute. The origin (00H, 00H) is the top left of the display. All data shown is in hexadecimal format.

6.1   Dummy Byte - Code: 00H (50μs)

Send a dummy byte.

6.2   Macro Start - Code: 01H – 07H (BUSY time depends on contents)

Start user defined macro 1-7

6.3   Back Space - Code: 08H (50μs)

Non destructive backspace. The cursor is moved left by the width of the currently select font. If the cursor is at the left end of the display, no cursor movement is made.

Note, this command is disabled when using proportional font.

6.4   Horizontal Tab - Code: 09H (50μs)

Cursor is moved right by the width of the currently select font. If the cursor is at the end of the display, no cursor movement is made.

6.5   Line Feed - Code: 0AH (50μs)

Moves the cursor down by the height of the currently selected font. If the cursor is at the bottom of the display, no cursor movement is made.

6.6   Home - Code: 0BH (50μs)

Moves the cursor horizontal position to 00H, the vertical positioning is dependent on the currently selected font, allowing for immediate character writing in the top-left corner of the display.

6.7   Vertical Tab - Code: 0CH (50μs)

Moves the cursor up one character row. If the cursor is at the top of the top end of the display, no cursor movement is made.

6.8   Carriage Return - Code: 0DH (50μs)

Moves the cursor horizontal position to 00H. The vertical position is unchanged.

6.9   Clear EOL - Code: 0EH (2.5ms)

Clear all characters from the current cursor position to the end of the display.

6.10   Test - Code: 0FH (50μs)

Place module into self-test mode. The module will repetitively show a few test screens. The test mode will stop on the next received byte.

6.11 Cursor Position - Code: 10H + X pos + Y pos (50μs)

Sets the cursor position.

6.12 Set Area - Code: 11H + X left + Y top + X right + Y bottom (50μs + 1ms [Last Byte])

Fill specified area. All dots within the specified area are illuminated. Please note that the cursor position is affected with this command.

6.13 Clear Area - Code: 12H + X left + Y top + X right + Y bottom (50μs + 1ms [Last Byte])

Clear specified area. All dots within the specified area are cleared. Please note that the cursor position is affected with this command.

6.14 Invert Area - Code: 13H + X left + Y top + X right + Y bottom (50μs + 1ms [Last Byte])

Invert specified area. All dots within the specified area are inverted. Please note that the cursor position is affected with this command.

6.15 Set Outline - Code: 14H + X left + Y top + X right + Y bottom (50μs + 1ms [Last Byte])

Draw box outline. All dots within the specified outline are unchanged. Please note that the cursor position is affected with this command.

6.16 Clear Outline - Code: 15H + X left + Y top + X right + Y bottom (50μs + 1ms [Last Byte])

Clear box outline. All dots within the specified outline are unchanged. Please note that the cursor position is affected with this command.

6.17 Set Pixel - Code: 16H (50μs)

Illuminate a single pixel at the current cursor position.

6.18 Clear Pixel - Code: 17H (50μs)

Clear a single pixel at the current cursor position.

6.19 Graphic Write - Code: 18H + Length + Data (50μs + 250μs [Each Data Byte])

Write graphical data, length, direct to display. See write mode command (1AH) for graphic orientation and cursor movements.

6.20 Reset - Code: 19H (500μs)

Resets display to power-on defaults:

Display is cleared
5x7 font selected
Write Mode = 00H
Brightness Level = 7
VFD Power = On

6.21   Write Mode - Code: 1AH + Data (50μs)

Data Bit 7	Graphic Data Orientation	0 = Horizontal, 1 = Vertical (default = 0)
Data Bit 6	Cursor Movement	0 = Horizontal, 1 = Vertical (default = 0)
Data Bit 5	Cursor Direction	0 = Forward, 1 = Backwards (default = 0)
Data Bit 4	Underscore Cursor	0 = off, 1 = on (default = 0)
Data Bit 3	Underscore Cursor	0 = static, 1 = flash (default = 0)
Data Bit 2	Unused	
Data Bit 1/0	Pen Type	00 = Overwrite
		01 = And
		02 = OR
		03 = XOR (default = 00)

6.22   Set Macro - Code: 1BH + Macro Number + Length + Data (50μs + 250μs [Each Data Byte])

Send macro data to EEPROM. Macro Number = 00H - 07H. Macro 0 is executed at power-up only. A maximum of 472 bytes is allowed for macro data. The display may flicker whilst writing macro data.

6.23   Brightness - Code: 1BH + Level (50μs)

Select one of the eight brightness levels ranging from F8H to FFH.

F8H = display off.
F9H = minimum.
FFH = maximum (default).

6.24   Erase Macros - Code: 1BH + 4DH (250ms)

Clear all downloaded macros in EEPROM. Screen may blank momentarily while macro data is being erased.

6.25   Lock/Unlock EEPROM - Code: 1BH + 4CH + 55H (50μs + 40ms [Last Byte])

All data contained within the non-volatile EEPROM is locked (4CH), and no changes are possible until the unlock command (55H) is executed.

6.26   Checksum - Code: 1BH + 43H (50μs)

All data received is added to the checksum. This command will read the lower 8-bits of that checksum, before being cleared. Please note that the checksum is cleared when executing the test mode.

6.27   Power On/Off - Code: 1BH + 50H / 46H (50μs)

50H = Turn on VFD power supply (default).
46H = Turn off VFD power supply (The display's contents will be preserved).

6.28   Hex/Binary Mode - Code: 1BH + 48H / 42H (50μs)

48H = Enable hex receive mode, character 60H is interpreted as a hexadecimal prefix.
42H = Disable hex receive mode.

Please note that hex mode is enabled at power up.

13

6.29   Set Serial Communications - Code: 1BH + 49H + Data

Set Asynchronous Communications, this command takes affect at power-up or hardware reset.

Data Bit 7 = Automatic I/O Send   1 = On, 0 = Off (default = 0)
Data Bit 6 = Packet Mode   1 = On, 0 = Off (default = 0)
Data Bit 5 = Communications Buffer   1 = On, 0 = Off (default = 0)
Data Bit 4 = Unused
Data Bit 2 = Parity   1 = Even, 0 = None (default = 0)
Data Bit 3/1/0 = baud rate   000 = 4800
                                      001 = 9600
                                      010 = 19200 (default = 0)
                                      011 = 38400
                                      100 = 57600
                                      101 = 76800
                                      110 = 1200
                                      111 = 2400

6.30   Enable I/O Port - Code: 1BH + 44H + Data (50µs + 80ms[Last Byte])

Set I/O port direction. A '1' indicates an input, a '0' an output. All output lines are immediately set low. All input lines have their pull-ups enabled. This value is stored in EEPROM and will automatically be set at power up.

6.31   Set Port Lines - Code: 1BH + 4FH + Data (50µs)

Set Output lines on I/O port, a '1' will set 5V on the output ports, or enable the pull-ups on the inputs.

6.32   Read Port - Code: 1BH + 52H (50µs)

Read current I/O port status. A single byte is transmitted showing the current state of the I/O lines.

6.33   Enable Key Scanning - Code: 1BH + 4BH (50µs + 40ms [Last Byte])

Set I/O port to key scanning. The I/O ports are continuously scanned for any key press. This mode is stored in EEPROM and will automatically be selected at power up.

6.34   Select Font - Code: 1CH / 1DH / 1EH (50µs)

Select font.   1CH = proportional mini font.
                1DH = fixed spaced 5x7 font.
                1EH = fixed spaced 10x14 font.

6.35   Graphic Area Write - Code: 1FH + X Left + Y Top + X Right + Y Bottom + Data (50µs + 250µs
[Each Data Byte])

Write graphic data within defined area. See write mode command (1AH) for graphic orientation and cursor movements.

14

6.36 Character Write - Code: 20H - FFH (500μs)

Display character from selected font.

6.37 Window 1 Select - Code: 1BH + 80H (50μs)

Select window 1 so that window and area command functions operate on the underlying data or text scroll.

6.38 Window 2 Select - Code: 1BH + 81H (50μs)

Select window 2 so that window and area command functions operate on the underlying data.

6.39 Window Define - Code: 1BH + 82H + X Left + Y Top + X Right + Y Bottom (50μs + 60μs [Last Byte])

Define window co-ordinates.

6.40 Window Mode - Code: 1BH + 83H + Mode (50μs)

Set window mode.   00H = Invert
01H = Clear
02H = Fill
03H = Pattern

6.41 Window Show - Code: 1BH + 84H (50μs)

Make selected window visible.

6.42 Window Kill - Code: 1BH + 85H (50μs)

Destroy selected window. Any scroll, flash and wipe effects will be stopped.

6.43 Window Flash - Code: 1BH + 86H + Number (50μs)

Flash selected window's underlying data.
Flash type depends on window's write mode.
Number = number of flashes.
FFH = infinite.
00H = stop flashing.

6.44 Window Flash Speed - Code: 1BH + 87H + Speed (50μs)

Set flash rate of selected window

0 = ~15ms	6 = ~250ms	12 = ~2.0sec
1 = ~30ms	7 = ~350ms	13 = ~2.5sec
2 = ~45ms	8 = ~500ms	14 = ~3.0sec
3 = ~100ms	9 = ~750ms	15 = ~3.5sec
4 = ~150ms	10 = ~1.0sec	
5 = ~200ms	11 = ~1.5sec	

Speed bits 4-7 = flash on duration, bits 0-3 = flash off duration.
Default speed = 88H (500ms on, 500ms off).

15

6.45 Window Wipe Effect - Code: 1BH + 88H + Wipe (50μs)

Perform a wipe action on the selected window's underlying data.

00H = left to right cover   06H = top to bottom uncover
01H = right to left cover   07H = bottom to top uncover
02H = top to bottom cover   08H = horizontal centre to edge cover
03H = bottom to top cover   09H = horizontal edge to centre uncover
04H = left to right uncover   0AH = vertical centre to edge cover
05H = right to left uncover   0BH = vertical edge to centre uncover

Note, all uncover wipes will alter the window co-ordinates.

6.46 Window Wipe Speed - Code: 1BH + 89H + Speed (50μs)

Set the wipe effect speed (pixels per second) for the selected window.

00H = Halt wipe   09H = ~157Hz
01H = ~17Hz   10H = ~315Hz
02H = ~35Hz   0AH = ~175Hz
03H = ~52Hz   0BH = ~192Hz
04H = ~70Hz (Default)   0CH = ~210Hz
05H = ~87Hz   0DH = ~227Hz
06H = ~105Hz   0EH = ~245Hz
07H = ~122Hz   0FH = ~262Hz
08H = ~140Hz

The wipe effect duration depends upon the size of the window.

6.47 Window Pattern Select - Code: 1BH + 8DH + Pattern (50μs)

Select pre-defined pattern (00H-0FH) for window:

00H 01H 02H 03H 04H 05H 06H 07H 08H 09H 0AH 0BH 0CH 0DH 0EH 0FH

6.48 Window Pattern Data - Code: 1BH + 8EH + Data (50μs)

A user 16x16 pixel pattern (32 bytes) can be defined for the selected window.
All data should be in vertical format with D7 uppermost.

6.49 Window Pattern Option - Code: 1BH + 8FH + Option (50μs)

Set window pattern options.

Bit 3 = invert pattern data   0 = Off, 1 = On (default = 0)
Bit 2 = pattern alignment   0 = Off, 1 = On (default = 0)
Bit 1 = pattern align with edge of window   0 = Bottom 1 = Top (default = 0)
Bit 0 = pattern align with edge of window   0 = Right, 1 = Left (default = 0)

6.50 **Scroll Text In Window - Code: 1BH + 90H + Mode + No + Data** (50μs + no of data bytes * 50μs [last byte])

Scroll text data within area defined by window 1.

Mode Bit 7 = Unused
Mode Bit 6 = Unused
Mode Bit 5 = Pad end of text with spaces   1 = On, 0 = Off
Mode Bit 4 = Scroll window's contents   1 = On, 0 = Off
Mode Bit 3 = Unused
Mode Bit 2 = Unused
Mode Bits 1 & 0 = Direction   00 = Scroll Up
                                                  01 = Scroll Down
                                                  10 = Scroll Left
                                                  11 = Scroll Right
No = Repeat number (00H = infinite)
Data = Text to be scrolled with 00H signalling end of text.

Use 0DH for multi-line scrolling messages. Up to 8 rows of text can be scrolled horizontally.

6.51 **Scroll Speed - Code: 1BH + 91H + Speed** (50μs)

Set window 1 scroll speed (pixels per second)

00H = Halt Scroll
01H = ~35Hz
02H = ~70Hz (Default)
03H = ~105Hz
04H = ~140Hz
05H = ~175Hz*
06H = ~210Hz*
07H = ~245Hz*
08H = ~315Hz*

*Horizontal scroll only.

6.52 **Select Extended Font - Code: 1BH + 98H + Font** (50μs)

Select extended font

Bits 0-2 = font number   000 =   5x5 ASCII mini font
                                          001 =   5x7 ASCII font
                                          010 =   10x14 ASCII font
                                          011 =   7x15 ASCII font
                                          100 =   5x7 Cyrillic font
                                          101 =   10x14 Cyrillic font

Bit 3 = Proportional / fixed spacing.   1 = proportional, 0 = fixed (Default = 1)

Bits 4-6 = Horizontal font spacing 1-8 pixels.   000 =   1 pixel (Default)
                                                  001 =   2 pixels
                                                  010 =   3 pixels
                                                  011 =   4 pixels
                                                  100 =   5 pixels
                                                  101 =   6 pixels
                                                  110 =   7 pixels
                                                  111 =   8 pixels

17

6.53   Draw Line - Code: 1BH + 9AH + X + Y (50µs)

Draws line from current cursor position to specified x, y. Cursor position is updated to x, y.

6.54   Auto Fade - Code: 1BH + 9CH + Level (50µs)

Perform automatic fade to a defined level.

Bits 0-2 = luminance level		
	000 =	0%
	001 =	14%
	010 =	28%
	011 =	43%
	100 =	57%
	101 =	71%
	110 =	86%
	111 =	100% (Default)

Bits 4-5 = speed		
	00 =	Fastest
	01	
	10	
	11 =	Slowest

6.55   Command Delay - Code: 1BH + 9FH + Delay (50µs + delay [Last Byte])

Delay any pending commands

00H = wait for display scan to finish.
01H-F0H = multiple of 10ms delay period (10ms to 2.5 seconds).
F8H = wait for Scroll to finish.
FAH = wait for Window 1 Flash to finish.
FBH = wait for Window 2 Flash to finish.
FCH = wait for Window 1 Wipe to finish.
FDH = wait for Window 2 Wipe to finish.

Note: If scroll or flash is set to infinite repeat, the delay is ignored.

7.0   Software Examples

7.1   Character Writes

The module contains 4 font sizes, a proportional 5x5 mini-font, 5x7 pixel, 7x15, and a 10x14 pixel font. Characters of any size can be written to any part of the display. All data sent to the module from 20H to FFH is treated as character data. Characters are positioned above the current cursor position, see Fig1. By default each character written will include a one pixel space on the right side of the character. After each character is written to the display, the cursor position is automatically advanced. If the cursor position reaches the end of the display, the host must reposition to the next line.

Fig 1, cursor positioning, example of writing two characters from cursor position 0,7.

The following example displays two text messages in the centre of the display.

5x7 FONT	SET CURSOR	DISPLAY TEXT

1DH   10H 15H 1FH   'NORITAKE ITRON'

SET CURSOR	DISPLAY TEXT

10H 1EH 27H   'VFD MODULES'

Displaying text in the small 5x7 font.

The next example displays one line of text using the 10x14 font.

10x14 FONT	SET CURSOR	DISPLAY TEXT

1EH   10H 21H 27H   '128x64'
Displaying text in the large 10x14 font.

The module can display a cursor to aid character positioning and text input. The size of the cursor depends upon the currently selected font, and can be set to flash or remain static.

5x7 FONT	SET CURSOR	DISPLAY TEXT	ENABLE FLASHING CURSOR

1DH   10H 0DH 0EH   'ENTER NAME: '   1AH 18H
Using the cursor to aid user input.

7.2   Area Commands

The following example displays three options for the user to select. Each option is contained within a box with a shadow effect. Drawing horizontal and vertical line using the fill area command creates the shadow effect.
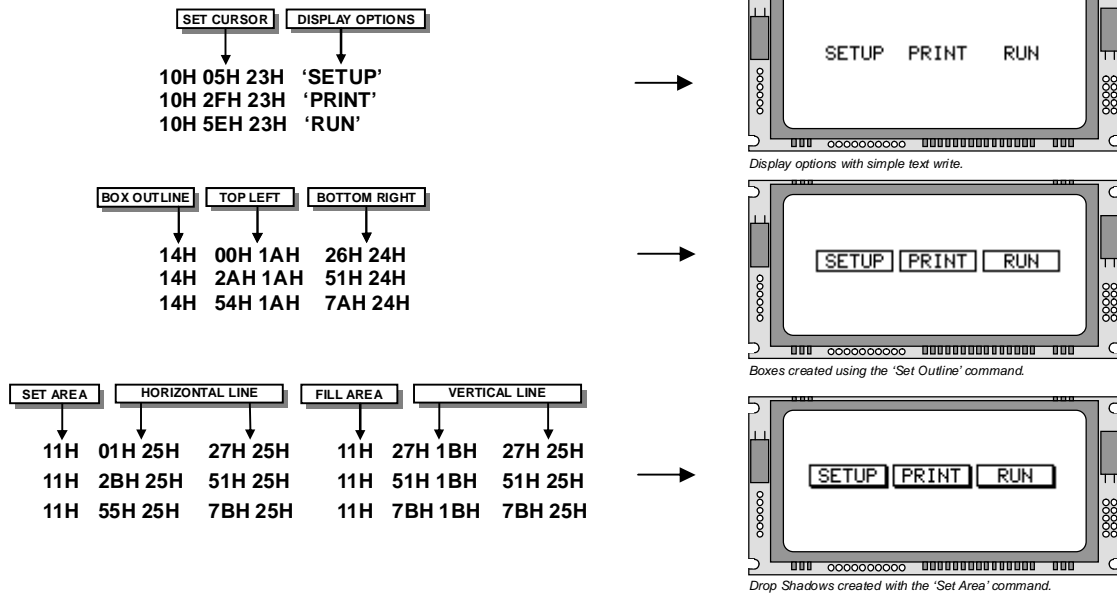

SET CURSOR	DISPLAY OPTIONS
10H 05H 23H	'SETUP'
10H 2FH 23H	'PRINT'
10H 5EH 23H	'RUN'

Display options with simple text write.

BOX OUTLINE	TOP LEFT	BOTTOM RIGHT
14H	00H 1AH	26H 24H
14H	2AH 1AH	51H 24H
14H	54H 1AH	7AH 24H

Boxes created using the 'Set Outline' command.

SET AREA	HORIZONTAL LINE		FILL AREA	VERTICAL LINE	
11H	01H 25H	27H 25H	11H	27H 1BH	27H 25H
11H	2BH 25H	51H 25H	11H	51H 1BH	51H 25H
11H	55H 25H	7BH 25H	11H	7BH 1BH	7BH 25H

Drop Shadows created with the 'Set Area' command.

The next example uses the invert area command to select one of the options.

INVERT AREA	TOP LEFT	BOTTOM RIGHT
13H	55H 1BH	79H 23H

*Option 'Run' selected with the 'Invert Area' command.*

7.3   Write Modes

By default, display data that is overwritten will be cleared prior to displaying any new data. This display data can be maintained whilst writing by selecting the 'OR' mode with the 'Write Mode' command, this will effectively merge the old data with the new. The 'AND' write mode will only display written data if existing data is present on the display. The other 'Write Mode' is 'XOR' which can be useful for writing text on an inverted display.

The following example uses the XOR mode to write text on a full display.

WRITE MODE	XOR MODE	SET AREA	TOP LEFT	BOTTOM RIGHT
		11H	00H 00H	7DH 3FH
1AH	03H	10H 18H 23H	'INVERETED TEXT'	

Displaying inverted text using the 'Write Mode' command.

20

This next example uses the XOR mode to display the percentage completed on a progress bar.

WRITE MODE	XOR MODE	10H 26H 1DH 'PROGRESS'
		14H 00H 22H 7DH 2CH
		11H 00H 22H 3CH 2CH
1AH	03H	10H 38H 2BH '50%'

Using inverting text for displaying progress level.
7.4   Graphic Writes

Graphical images can be displayed on the VFD module in either a horizontal or vertical byte orientation. After each graphical data write, the cursor is automatically advanced, depending upon the direction selected in the 'Write Mode' command. The most significant bit is positioned to the top (vertical data) or to the left (horizontal data).

The following example displays a simple graphical image using horizontal graphic data. The write mode is first set to horizontal data format, with a vertical cursor movement. The cursor is positioned before sending the 8 byte of graphical data using the graphics command.

- 1CH
- 5CH
- 48H
- 3EH
- 1DH
- 1DH
- 14H
- 36H
Graphic Image using horizontal data

The following example displays a simple graphical image using horizontal graphic data. The write mode is first set to horizontal data format, with a vertical cursor movement. The cursor is positioned before sending the 8 byte of graphical data using the graphics command.
SET HORIZONTAL WRITE MODE				
	SET CURSOR	GRAPHIC WRITE	LENGTH	GRAPHIC DATA
1AH 40H	10H 1FH 1CH	18H	08H	1CH 5CH 48H 3EH 1DH 1DH 14H 36H

The next example displays a simple graphical image using vertical graphical data. The write mode is first set to vertical data format, with a horizontal cursor movement. The cursor is positioned, then the top 20 bytes are sent using the graphic write command. The cursor is then repositioned to send the bottom 20 graphical bytes.
Graphic Image using vertical data

SET VERTICAL WRITE MODE				
	SET CURSOR	GRAPHIC WRITE	LENGTH	GRAPHIC DATA
1AH 80H	10H 47H 18H	18H	14H	00H 00H 00H 00H 07H 04H C7H FEH 72H 73H
				32H 3EH 3FH 1DH 00H 00H 00H 00H 00H 00H
	10H 47H 20H	18H	14H	00H 3CH 42H 81H B9H C1H 42H 7CH 20H D8H
				FCH 3CH FCH CAH 49H B1H 89H 42H 3CH 00H

Displaying graphic images in vertical and horizontal format.

The graphic area write command 1FH uses top-left and bottom-right XY co-ordinates to define an area to which graphical data bytes will be written. The orientation is set-up using the write mode command 1AH. Unused bits are masked where the screen area is not a byte multiple.
21

7.5   Macros

A string of data and commands can be sent to the module and stored in non-volatile EEPROM by using the macro feature. This string of data and commands can then be executed by using just one command. Up to 8 macros can be used at any one time one of these is executed at power-up.
This example uses the first macro (Macro 0) to display an initial message at power-up.

WRITE TO MACRO-0	LENGTH		POWER-UP MESSAGE

1BH 00H 24H   10H 1EH 1DH 'PLEASE WAIT'
              10H 06H 29H 'INITIALISING SYSTEM'

Power-Up message using Macro 0.

This next example saves the previous graphic icon into Macro 1, and then is used as a user-defined character.

WRITE TO MACRO-1	LENGTH		GRAPHIC DATA

1BH 01H 0CH   1AH 40H 18H 08H 1CH 5CH
              48H 3EH 1DH 1DH 14H 36H

SET CURSOR	DISPLAY ICON	SET CURSOR	DISPLAY ICON

10H 05H 15H   01H   10H 72H 14H   01H
10H 35H 1EH   01H   10H 46H 26H   01H

Using Macros as user-defined characters.

This example creates a display template, which can be helpful if many screens require the same look.

WRITE TO MACRO-2	LENGTH	RESET	AREA COMMANDS

1BH 02H 1BH   19H 14H 02H 02H 7BH 3DH   11H 00H 00H 04H 04H
                     11H 00H 3BH 04H 3FH   11H 79H 00H 7DH 04H
                     11H 79H 3BH 7DH 3FH

DISPLAY TEMPLATE	SET CURSOR	DISPLAY MESSAGE

02H   10H 1CH 23H 'SYSTEM READY'

Using Macros as a screen template.

7.6   Using the Checksum

All data written to the module is added to an internal checksum. The lower 8-bits of this checksum can be read at any time from the module by the host system to confirm accurate data transfer. It is up to the user if or when this feature should be used. The checksum is cleared at power-up and after each checksum read.

Example: Read checksum at power-up, or directly after it has been cleared.

READ CHECKSUM		CHECKSUM
1BH 43H	SENT TO HOST ⟶	5EH

Example: Read checksum after data has been written to the display.

| WRITE DATA	READ CHECKSUM		CHECKSUM
19H 31H 32H 33H	1BH 43H	SENT TO HOST ⟶	0DH

7.7   Windows

The user can create two independent windows which can manipulate underlying display information without changing the data stored in RAM. The window area can be filled with pattern data as well as flashing and wipe effects. Window 1 can be used for scrolling multi-line text.

SELECT FONT

1BH 98H 0AH

SET CURSOR	DISPLAY TEXT
10H 0EH 15H	**"WELCOME TO"**
10H 17H 27H	**"NORITAKE"**
10H 26H 39H	**"ITRON"**

⟶

Display without windows.

SELECT WINDOW 1

WINDOW FILL   SHOW WINDOW   DEFINE WINDOW CO-ORDINATES

1BH 80H

1BH 83H 02H   **1BH 82H 10H 04H 2FH 3DH**
                    1BH 84H

1BH 81H ⟵   **1BH 82H 50H 04H 6FH 3DH**
1BH 83H 00H   **1BH 84H**

WINDOW INVERT   SELECT WINDOW 2   SHOW WINDOW   DEFINE WINDOW CO-ORDINATES

⟶

*Display 2 windows: - Fill & Invert.*

7.8 Flashing

The 2 windows can be utilized for display area flashing. The window flash speed and the flash amount are user-defined. The display's contents are preserved during the flash period. The flashing can also be stopped at any time.
Invert flash example.

SELECT FONT		SET CURSOR		DISPLAY TEXT

1BH 98H 09H   **10H 27H 1FH**   "WARNING!!!"

10H 17H 27H   "Power Overload"

SELECT WINDOW 1		DEFINE WINDOW CO-ORDINATES
	WINDOW INVERT	INFINITE FLASH

1BH 80H   **1BH 82H 26H 17H 54H 1FH**

1BH 83H 00H   **1BH 86H FFH**

Window flashing.

The window mode can be changed to 'clear' for a flash on/off effect.
The flash on and off time duration are independent, and can be set at anytime.

WINDOW CLEAR	FLASH SPEED

1BH 83H 01H   **1BH 87H 44H**
7.9 Scrolling Text

The module has the ability to scroll multi-line text within any area of the display defined by window 1. Text can be scrolled in a horizontal or vertical direction. The scroll operates independently from other commands, allowing display changes during the scroll effect. All scroll data is stored within a separate 256-byte buffer. Scrolls can be repeated a defined amount, and any font can be chosen. For multi-line scrolls, each line should be terminated by a carriage return code (0DH). A maximum of 8-lines can be scrolled horizontally.

Scroll example: -

SELECT WINDOW 1	SELECT FONT	DEFINE WINDOW CO-ORDINATES

1BH 80H   **1BH 82H 10H 10H 67H 2FH**

1BH 98H 0BH

1BH 90H   02H   01H   "Scrolling" 0DH "Text Message" 00H

| SCROLL	LEFT	ONCE	SCROLL TEXT	NEW LINE	SCROLL TEXT	TEXT END

Scrolling horizontal text data.

7.10 Patterns

One of 16 pre-defined pattern designs can be selected, and each window can have a uniquely associated pattern. Each pattern consists of 16x16 pixels and can be aligned to the top-left, top-right, bottom-left or bottom-right corner of the window. The pattern data can be inverted (negative image) if required. A user defined pattern can also be created for each window.

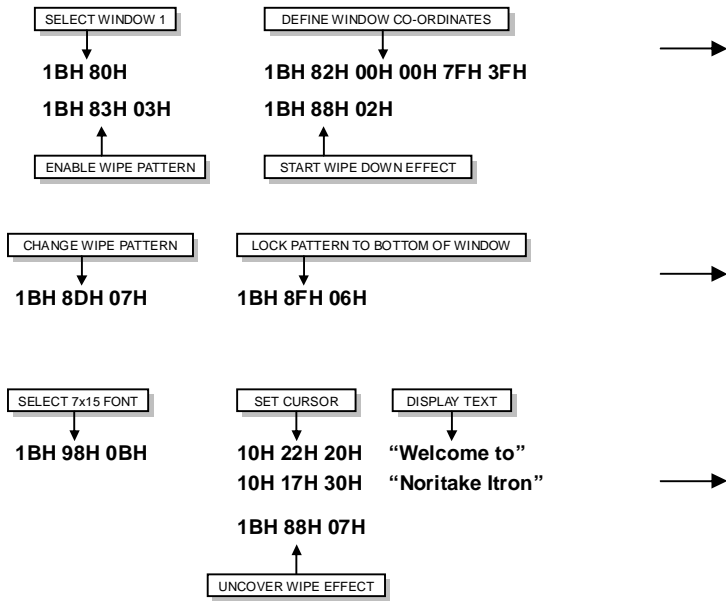

Custom Pattern Data.

Pattern example.

| SELECT WINDOW 1 | | SHOW WINDOW |
| ENABLE PATTERN | | DEFINE WINDOW CO-ORDINATES |

1BH 80H   **1BH 82H 00H 00H 7FH 3FH**

1BH 83H 03H   **1BH 84H**

1BH 8EH ← DEFINE PATTERN   32-BYTE PATTERN DATA

86H FCH FEH 86H 7EH 86H 00H 86H FCH 86H 86H FEH 86H 7EH 86H 00H

86H FCH FEH 86H 7EH 86H 00H 86H FCH 86H 86H FEH 86H 7EH 86H 00H

INVERT

1BH 8FH 08H

Define custom pattern.
7.11 Wipe Effects

The wipe commands modify the window co-ordinates to cover or uncover the display data. The display data is retained when using any of the wipes. The wipe effects operate independently from other commands, allowing display changes during the effect. The time duration of the wipe effect is dependant upon the defined wipe speed and the window size. The window mode is used to select the wipe fill type - Clear, Fill, Invert or Pattern. A curtain effect can be created using a pattern wipe with the align feature, the pattern data will scroll in unison with the wipe.
There are 12 wipe actions to choose from.

00H - Left-to-Right Cover.	01H - Right -to-Left Cover.	02H - Top-to-Bottom Cover.	03H - Bottom-to-Top Cover.
04H - Left-to-Right Uncover.	05H - Right -to-Left Uncover.	06H - Top-to-Bottom Uncover.	07H - Bottom-to-Top Uncover.
08H - H. Centre-to-Edge Cover.	09H - H. Edge-to-Centre Uncover.	0AH - V. Centre-to-Edge Cover.	0BH - V. Edge-to-Centre Uncover.

Wipe examples.

SELECT WINDOW 1

1BH 80H

1BH 83H 03H

ENABLE WIPE PATTERN

DEFINE WINDOW CO-ORDINATES

1BH 82H 00H 00H 7FH 3FH

1BH 88H 02H

START WIPE DOWN EFFECT

Wipe down effect with pattern enabled.

CHANGE WIPE PATTERN

1BH 8DH 07H

LOCK PATTERN TO BOTTOM OF WINDOW

1BH 8FH 06H

Change pattern.

SELECT 7x15 FONT

1BH 98H 0BH

SET CURSOR

10H 22H 20H

10H 17H 30H

1BH 88H 07H

UNCOVER WIPE EFFECT

DISPLAY TEXT

"Welcome to"

"Noritake Itron"

Uncover hidden text.

8.0 Character Sets

9.0 Setup

9.1 Push Button

The VFD module features a buffered asynchronous serial port at RS232 level and an unbuffered parallel port at CMOS level. Interface selection/set-up can be made using the single push button switch on the back of the module. Pressing the switch for the first time will display the initial configuration menu. On each subsequent switch press the menu pointer will advance. The current menu item will be selected if the switch is not pressed within 2 seconds.

To select the required interface, press the switch until the 'COMMS' item has been selected.

→
```
 TEST    EEPROM
COMMS ◆  EXIT
```

Wait 2 seconds for the communication menu to be displayed. Press the switch until the required communication method is selected. The factory default interface is "SERIAL".

→
```
SERIAL ◆
PARALLEL   EXIT
```

Wait 2 seconds for the related communication settings and select the property to be edited.

→
```
 DATA ◆   MODE
CLOCK    EXIT
```

Wait 2 seconds to display the related communication settings. The current configuration is displayed first. The factory default settings are "DATA: D7-D0", "EDGE: RISE:", "MODE: BUFFER".

→
```
ORDER:  D7-D0
```

Interface selection example.

Note: Production items can be supplied with the configuration preset and fixed.

13.0   Notice for the Cautious Handling of VFD Modules

Handling and Usage Precautions:
Please carefully follow the appropriate product application notes for proper usage, safety handling, and operation standards for maximum performance.

[VFD tubes are made of glass]
- Because the edges of the VFD glass-envelop are not smooth, it is necessary to handle carefully to avoid injuries to your hands
- Please avoid breaking the VFD glass-envelop to prevent injury from sharp glass particles.
- The tip of the exhaust pipe is fragile so avoid shock from impact.
- It is recommended to allow sufficient open space surrounding the exhaust pipe to avoid possible damage.
- Please design the PCB for the VFD-module within 0.3 mm warping tolerance to avoid any forces that may damage the display due to PCB distortion causing a breakdown of the electrical circuit leading to VFD failure.

[High voltage]
- Avoid touching conductive electrical parts, because the VFD-module uses high voltage exceeding 30,100 volts.
- Even when electric power is turned off, it may take more than one minute for the electrical current to discharge.

[Cable connection]
- Do not unplug the power and/or data cables of VFD-modules during operating condition because unrecoverable damage may result.
- Sending input signals to the VFD-module during a power off condition sometimes causes I/O port damage.
- It is recommended to use a 30 cm or shorter signal cable to prevent functional failures.

[Electrostatic charge]
- VFD-modules need electrostatic free packaging and protection from electrostatic charges during handling and usage.

[Structure]
- During operation, VFD and VFD-modules generate heat. Please consider sufficient heat radiation dissipation using heat sink solutions.
- We prefer to use UL grade materials or components in conjunction with VFD-modules.
- Wrap and twist motion causes stress and may break VFDs & VFD modules. Please adhere to allowances within 0.3mm at the point of attachment.

[Power]
- Apply regulated power to the VFD-module within specified voltages to protect from failures.
- Because some VFD-modules may consume in rush current equal to twice the typical current at power-on timing, we recommend using a sufficient power capability and quick starting of the power regulator.
- VFD-module needs a specified voltage at the point of connection. Please use an adequate power cable to avoid a decrease in voltage. We also recommend inserting a power fuse for extra protection.

[Operating consideration]
- Illuminating phosphor will decrease in brightness during extended operation. If a fixed pattern illuminates for an extended period (several hours), the phosphor efficiency will decrease compared to the non operating phosphor causing a non uniform brightness among pixels. Please consider programming the display patterns to use all phosphor segments evenly. Scrolling may be a consideration for a period of time to refresh the phosphor condition and improve even illumination to the pixels.
- We recommend using a signal cable 30cm or less to avoid some possible disturbances to the signal.

[Storage and operating environment]
- Please use VFD-modules under the recommended specified environmental conditions. Salty, sulphuric and dusty environments may damage the VFD-module even during storage.

[Discard]
- Some VFDs contain a small amount of cadmium in the phosphor and lead in the solder. When discarding VFDs or VFD-modules please adhere to governmental related laws or regulations.

[Others]
- Although the VFD-module is designed to be protected from electrical noise, please plan your circuitry to exclude as much noise as possible.
- Do not reconstruct or repair the VFD-module without our authorization. We cannot assure the quality or reliability of unauthorized reconstructed VFD-modules.

Notice:
We do not authorize the use of any patents that may be inherent in these specifications.
Neither whole nor partial copying of these specifications is permitted without our approval.
If necessary, please ask for assistance from our sales consultant.
This product is not designed for military, aerospace, medical or other life-critical applications. If you choose to use this product for these applications, please ask us for prior consultation or we cannot take responsibility for problems that may occur.
